

Epic / Repository scan and task review ▾

Okay a lot of changes have happened and theres been merges at stuff - can you scan the repo and tell me if everything looks good and where i should go next to continue comleteing my tasks (you can see my tasks on clickup which is conected)

Loaded tools >

Let me grab your workspace structure and open tasks at the same time, while also scanning the project files.

Used ClickUp integration >

Now let me also scan the project knowledge for repo/code context:

Searched project for "repository structure code implementation status" >

Now I have a clear picture. Let me compile this into a useful summary for you.

Now I have everything I need. Let me put together a clear summary.

✓ Connecting to visualize...

Here's the full picture after scanning your ClickUp and the repo knowledge:

What's done (Sprints 1 & 2 complete): Planning, Docker Compose, the Python backend (register/login with Argon2id, JWT, CSRF, Redis rate-limiting), X25519 key generation, TOFU endpoint, private key encrypted at rest, HTTP security headers, and the C++ `Message` + `MessageStore` classes. The Solidity contract is also written with 4 tasks done (structs, events, Ownable, view functions).

The critical gap — Sprint 3 (C++ Socket Layer) is 0% done. This is blocking everything else. The 8 tasks there need to happen first: `socket()` + `getaddrinfo()`, TLS handshake with `SSL_VERIFY_PEER`, the `Client` class, partial-read loop, then HTTP POST/GET over TLS. The EPIC guide explicitly warns that using only high-level HTTP libraries without raw socket code loses marks on the network criterion.

Priority order:

1. **Sprint 3** — C++ socket/TLS layer (unblocks Sprint 5)
2. **Sprint 4** — finish blockchain: compile in Remix, deploy to Sepolia, wire up `recordConversationDigest()`, verification page

3. **Sprints 5 & 6 in parallel** — frontend (Web Crypto API, inbox, compose, WSS) + security hardening (UFW, fail2ban, IDOR audit, constant-time MAC)
4. **Sprints 7-9** — pentest, all docs, and submission prep before **3 June 17:00**

You've got 10 days. The backend auth foundation is solid — click any card above to dive into a specific sprint and I can help you work through the tasks.

AI_Prompt_Artefacts_updated.docx

89 lines

DOCX

Look back through this conversation and identify every message I (the human) sent that could serve as an AI prompt artefact for a university submission. I need prompts that demonstrate: - Security-driven thinking (e.g. specifying exact crypto parameters, security properties, failure modes) - Critical judgement (e.g. constraining scope, correcting a previous output, rejecting something) - Technical specificity (e.g. naming exact files, algorithms, RFCs, line numbers) For each one you find, return: 1. The exact text of my message Skip anything that's just a short question or command like "give me the cmds" or "yes do that". I only want substantive prompts. can you add them to this file , just the straight prompts

Read the SKILL.md for docx >

Now let me look at the existing doc and the current conversation for new artefacts to add.

Ran 4 commands, viewed a file >

Now I have the full picture of the existing document. I need to scan the current conversation for new qualifying prompts and append them. From this conversation, the qualifying ones are:

1. The task scan + ClickUp request (substantive, shows critical project management thinking)
2. This current prompt — asking to identify artefacts from the conversation and add them to the file (meta-artefact, demonstrates critical evaluation of AI output)

Let me now append the new prompts (18 and 19) to the document.

Edited a file, ran a command, read a file >

Added two new prompts from this conversation — **Prompt 18** (the repo/ClickUp scan request) and **Prompt 19** (this meta-artefact prompt asking to identify and collate qualifying prompts). Both are good artefacts: 18 shows integrated tooling judgment and cross-system reasoning, and 19 demonstrates critical evaluation of AI output — one of the three criteria explicitly called out in the rubric.

Ai prompt artefacts updated
